Activity #2

Objective: To experience and understand the benefits of pair programming while creating a program to check if a number is a palindrome.

Instructions:

1. **Form Pairs:** Find a partner to work with.
2. **Work on a Task:** Implement a program that checks if a given number is a palindrome.
3. **Pair Programming Session:** Decide who will be the driver (actively writing the code) and who will be the observer/navigator (reviewing the code, providing suggestions, and thinking about the overall strategy). Switch roles after 15-20 minutes. *The project took around 15 - 20 minutes in total to complete. Joseph was the writer while Christian and I were helping/reviewing his work.*
5. **Reflect and Discuss:** After both of you have had a chance to be the driver and observer, discuss your experience. Consider questions like:
 - What challenges and benefits did you encounter in creating the palindrome number checker? *The biggest challenge for us was probably deciding what language to use for the project, we were thinking Python, but we went with Java instead since we were most proficient in that. Also, Christian and Joseph found it difficult to communicate on the project since they take more pride in their individual work. I on the other hand, thought it was nice to have a group*

to communicate with because I don't do so well on my own when coding; however, talking with a group helps me with communicating my ideas better and makes the code much simpler.

- Did collaboration improve the code quality? Why or why not?

There wasn't much to improve on since the assignment was so simple and quick.

- How did communication contribute to the success of the task?

Communication contributed to success because it allowed Christian and I to navigate Joe out of the errors he was stuck in.

- What insights did you gain from your partner during the session?

For me personally, I tend to overthink while coding thus ending up being stuck and not knowing what to do. When I have a group, it is good for me since I get to analyze/observe what my group members are doing to help me with my coding in the future.
